

# Solutions Architecture

**Solution Architecture & Design** provides customers with professional IT technical services, whether to enhance existing documentation or as part of the supporting programme/project collateral. The range of services is extensive including infrastructure, application and business level constructions and documentation.

Technical briefs can range from low budget, proprietary, local solutions to enterprise and national level strategies. MEC design to the customer's requirements, lean and mean design where the primary focus is time or financially constrained, to data centre shared services, and high bandwidth transport networks to support enterprise management, virtualisation and resource optimisation.

MEC focus on providing a fully comprehensive range of design service- documentation including:

1. Executive summary
2. Clear high level
3. Detailed low level
4. Configuration scripts

... Key categories include designs, pricing, references, contents, summary, security, conclusions, risks,

assumptions, issues and dependencies (RAID).

MEC believe that designs can still be innovative but not sacrifice the local imperatives or deliver an over engineered, expensive solution.

MEC can comply with the customer's documentation templates and methodologies or provide their own, including Unified Modelling Language (UML) representations.
