

Integration & Interfacing

Integration & Interfacing has always been the backbone to enabling specialised clinical system to communicate with each other. As such this area is both complex and difficult. MEC does not supply product but provides services that include an understanding intelligent interfacing in health care delivery, management processes needed to supported the organisation and guidance on how to utilise existing interface technologies to optimise the intercommunication.

MEC understand how to bring information together and are not constrained to a specific technological product set. MEC's depth of knowledge for underlying standards and best practice means they can assist in the most difficult of projects.

MEC can help bring the delivery of integration solutions together by managing the parties to clearly establish common, optimised, design and build a holistic data communications framework.

Integration takes intersystem operability to another level of complexity that are covered under MEC services. MEC's knowledge and guidance capabilities in this area mean that existing or new systems requiring both user-level contextual data management and back-end interfacing can be rapidly assessed, design options proposed and delivered with low overheads for the Customer.
